WILL'S CIGARETTES

The Croton Dam, New York.

In order to artificially create a large body of water where no natural lake is available, or to increase the size of an existing lake, a dam is constructed to raise the level of the water. The new Croton Dam, which holds back the water supply of New York City, is, next to the Pyramids of Egypt, the largest masonry structure in the world. It is 160 feet high, has a total length of 2,168 feet, and impounds 32,000,000,000 gallons of water.
